Heegaard decomposition of 3-manifolds

Definition

Let *Y* be a closed oriented and connected 3–manifold. A *Heegaard decomposition* is the presentation of *Y* as a union $Y = H_1 \cup_{\Sigma} \cup H_2$, where H_1 and H_2 are handlebodies and Σ is a closed connected surface.

Heegaard decomposition of 3-manifolds

Definition

Let *Y* be a closed oriented and connected 3–manifold. A *Heegaard decomposition* is the presentation of *Y* as a union $Y = H_1 \cup_{\Sigma} \cup H_2$, where H_1 and H_2 are handlebodies and Σ is a closed connected surface.

Theorem

Each three manifold admits a Heegaard decomposition. Any two Heegaard decompositions are related by stabilizations and destabilizations.

Heegaard decomposition of 3-manifolds

Definition

Let *Y* be a closed oriented and connected 3–manifold. A *Heegaard decomposition* is the presentation of *Y* as a union $Y = H_1 \cup_{\Sigma} \cup H_2$, where H_1 and H_2 are handlebodies and Σ is a closed connected surface.

Theorem

Each three manifold admits a Heegaard decomposition. Any two Heegaard decompositions are related by stabilizations and destabilizations.

Sketch of proof.

Use Morse theory.

 The only manifold admitting a Heegaard decomposition of genus 0 is S³.

- The only manifold admitting a Heegaard decomposition of genus 0 is S³.
- For genus 1 H₁ and H₂ are two solid tori glued along their boundary. Then Y is either S³ or a lens space.

- The only manifold admitting a Heegaard decomposition of genus 0 is S³.
- For genus 1 H₁ and H₂ are two solid tori glued along their boundary. Then Y is either S³ or a lens space.

Problem

Prove the last statement.

Let $D_z = \{z\} \times \Sigma \times \ldots \times \Sigma$. Then D_z is a divisor in $Sym^g(\Sigma)$.

The chain complex \widehat{CF} and \widehat{CF}^-

• The chain complex \widehat{CF} is defined (over \mathbb{Z}_2) by intersection points $\mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}$.

The chain complex \widehat{CF} and \widehat{CF}^-

- The chain complex \widehat{CF} is defined (over \mathbb{Z}_2) by intersection points $\mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}$.
- The chain complex CF^- is defined over $\mathbb{Z}_2[U]$ by $\mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}$.

- The chain complex \widehat{CF} is defined (over \mathbb{Z}_2) by intersection points $\mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}$.
- The chain complex CF^- is defined over $\mathbb{Z}_2[U]$ by $\mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}$.
- The differential counts holomorphic maps φ: D → Sym^g such that φ(-1) = x, φ(1) = y, φ_{∂-D} ⊂ T_α and φ_{∂+D} ⊂ T_β. We make it precise.

- The chain complex \widehat{CF} is defined (over \mathbb{Z}_2) by intersection points $\mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}$.
- The chain complex CF^- is defined over $\mathbb{Z}_2[U]$ by $\mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}$.
- The differential counts holomorphic maps φ: D → Sym^g such that φ(-1) = x, φ(1) = y, φ_{∂-D} ⊂ T_α and φ_{∂+D} ⊂ T_β. We make it precise.
- Define π₂(x, y) a set of homotopy classes of continuous maps as above.

- The chain complex \widehat{CF} is defined (over \mathbb{Z}_2) by intersection points $\mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}$.
- The chain complex CF^- is defined over $\mathbb{Z}_2[U]$ by $\mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}$.
- The differential counts holomorphic maps φ: D → Sym^g such that φ(-1) = x, φ(1) = y, φ_{∂-D} ⊂ T_α and φ_{∂+D} ⊂ T_β. We make it precise.
- Define π₂(x, y) a set of homotopy classes of continuous maps as above.
- For each φ ∈ π₂(x, y) there is a uniquely defined integer, the Maslov class, μ(φ). This is the dimension of the moduli space of of holomorphic maps.

- The chain complex \widehat{CF} is defined (over \mathbb{Z}_2) by intersection points $\mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}$.
- The chain complex CF^- is defined over $\mathbb{Z}_2[U]$ by $\mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}$.
- The differential counts holomorphic maps φ: D → Sym^g such that φ(-1) = x, φ(1) = y, φ_{∂-D} ⊂ T_α and φ_{∂+D} ⊂ T_β. We make it precise.
- Define π₂(x, y) a set of homotopy classes of continuous maps as above.
- For each φ ∈ π₂(x, y) there is a uniquely defined integer, the Maslov class, μ(φ). This is the dimension of the moduli space of of holomorphic maps.
- The differential for \widehat{CF} is

$$\partial \mathbf{x} = \sum_{\mathbf{y} \in \mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}} \sum_{\phi \in \pi_2(\mathbf{x}, \mathbf{y}) : \ \mu(\phi) = 1, n_z(\phi) = 0} \# \mathcal{M}(\phi) \mathbf{y}.$$

The differential for CF^- (and later for CF^∞) is

$$\partial x = \sum_{\mathbf{y} \in \mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}} \sum_{\phi \in \pi_{2}(x, y): \ \mu(\phi) = 1} \# \mathcal{M}(\phi) U^{n_{z}(\phi)} \mathbf{y}.$$

(日)

The differential for CF^- (and later for CF^∞) is

$$\partial x = \sum_{y \in \mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}} \sum_{\phi \in \pi_2(x,y): \ \mu(\phi) = 1} \# \mathcal{M}(\phi) U^{n_z(\phi)} y.$$

The complex CF^{∞} arises from CF^{-} by replacing $\mathbb{Z}_{2}[U]$ by $\mathbb{Z}_{2}[U, U^{-1}]$.

The differential for CF^- (and later for CF^∞) is

$$\partial x = \sum_{y \in \mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}} \sum_{\phi \in \pi_2(x,y): \ \mu(\phi) = 1} \# \mathcal{M}(\phi) U^{n_z(\phi)} y.$$

The complex CF^{∞} arises from CF^{-} by replacing $\mathbb{Z}_{2}[U]$ by $\mathbb{Z}_{2}[U, U^{-1}]$. The complex CF^{+} is the quotient CF^{∞}/CF^{-} .

The differential for CF^- (and later for CF^∞) is

$$\partial x = \sum_{\mathbf{y} \in \mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}} \sum_{\phi \in \pi_{2}(x, y): \ \mu(\phi) = 1} \# \mathcal{M}(\phi) U^{n_{z}(\phi)} \mathbf{y}.$$

The complex CF^{∞} arises from CF^{-} by replacing $\mathbb{Z}_{2}[U]$ by $\mathbb{Z}_{2}[U, U^{-1}]$. The complex CF^{+} is the quotient CF^{∞}/CF^{-} . The short exact sequence $0 \rightarrow CF^{-} \rightarrow CF^{\infty} \rightarrow CF^{+} \rightarrow 0$ gives rise to an exact triangle in homology.

The differential for CF^- (and later for CF^∞) is

$$\partial x = \sum_{\mathbf{y} \in \mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}} \sum_{\phi \in \pi_{2}(\mathbf{x}, \mathbf{y}): \ \mu(\phi) = 1} \# \mathcal{M}(\phi) U^{n_{z}(\phi)} \mathbf{y}.$$

The complex CF^{∞} arises from CF^{-} by replacing $\mathbb{Z}_{2}[U]$ by $\mathbb{Z}_{2}[U, U^{-1}]$. The complex CF^{+} is the quotient CF^{∞}/CF^{-} . The short exact sequence $0 \rightarrow CF^{-} \rightarrow CF^{\infty} \rightarrow CF^{+} \rightarrow 0$ gives rise to an exact triangle in homology.

Problem

Prove that there exists a short exact sequence

 $0 \to \widehat{CF} \to CF^+ \xrightarrow{\cdot U} CF^+ \to 0$ giving rise to a long exact sequence in homology.

The differential for CF^- (and later for CF^∞) is

$$\partial x = \sum_{\mathbf{y} \in \mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}} \sum_{\phi \in \pi_{2}(\mathbf{x}, \mathbf{y}): \ \mu(\phi) = 1} \# \mathcal{M}(\phi) U^{n_{z}(\phi)} \mathbf{y}.$$

The complex CF^{∞} arises from CF^{-} by replacing $\mathbb{Z}_{2}[U]$ by $\mathbb{Z}_{2}[U, U^{-1}]$. The complex CF^{+} is the quotient CF^{∞}/CF^{-} . The short exact sequence $0 \rightarrow CF^{-} \rightarrow CF^{\infty} \rightarrow CF^{+} \rightarrow 0$ gives rise to an exact triangle in homology.

Problem

Prove that there exists a short exact sequence

 $0 \to \widehat{CF} \to CF^+ \xrightarrow{\cdot U} CF^+ \to 0$ giving rise to a long exact sequence in homology.

A remark. The complexes have a relative grading, called the Maslov grading, with $M(x) - M(y) = \mu(\phi) - 2n_z(\phi)$.

Spin-c structures

Definition

A spin-c structure on a manifold *M* is a choice of a complex line bundle $L \rightarrow M$ together with a choice of spin structure on $TM \otimes L^{-1}$.

Spin-c structures

Definition

A spin-c structure on a manifold *M* is a choice of a complex line bundle $L \rightarrow M$ together with a choice of spin structure on $TM \otimes L^{-1}$.

Then ∇F is non-vanishing.

Each generator $x \in \widehat{CF}$ determines a spin-c structure on M

Choose a generator $x \in \widehat{CF}$. This is the g-tuple of points x_1, \ldots, x_g such that $x_j \in \alpha_j \cap \beta_{\sigma(j)}$. Each point x_j corresponds to a trajectory of ∇F connecting index 1 and 2 critical points. Remove all these trajectories from *M*. Remove the trajectory of ∇F through the marked point *z*. Then ∇F is non-vanishing.

Each generator $x \in \widehat{CF}$ determines a spin-c structure on M

Problem

Show that if the differential from x to y is non-trivial, then x and y determine the same spin-c structure.

- A TE N A TE N

Choose a generator $x \in \widehat{CF}$. This is the g-tuple of points x_1, \ldots, x_g such that $x_j \in \alpha_j \cap \beta_{\sigma(j)}$. Each point x_j corresponds to a trajectory of ∇F connecting index 1 and 2 critical points. Remove all these trajectories from *M*. Remove the trajectory of ∇F through the marked point *z*. Then ∇F is non-vanishing.

Each generator $x \in \widehat{CF}$ determines a spin-c structure on M

Problem

Show that if the differential from x to y is non-trivial, then x and y determine the same spin-c structure.

Given that, the chain complexes split as direct sums of subcomplexes corresponding to different spin-c structures.

The homologies HF^+ , HF^- , HF^∞ and \widehat{HF} are independent of the choices made and are invariants of (Y, \mathfrak{s}) . Moreover, if Y is a rational homology sphere, then $HF^\infty(Y, \mathfrak{s}) = \mathbb{Z}_2[U, U^{-1}]$.

The homologies HF^+ , HF^- , HF^∞ and \widehat{HF} are independent of the choices made and are invariants of (Y, \mathfrak{s}) . Moreover, if Y is a rational homology sphere, then $HF^\infty(Y, \mathfrak{s}) = \mathbb{Z}_2[U, U^{-1}]$.

• The original result shows that a change of data induces an isomorphism of HF groups. Therefore the *isomorphism class of groups is well defined*.

The homologies HF^+ , HF^- , HF^∞ and \widehat{HF} are independent of the choices made and are invariants of (Y, \mathfrak{s}) . Moreover, if Y is a rational homology sphere, then $HF^\infty(Y, \mathfrak{s}) = \mathbb{Z}_2[U, U^{-1}]$.

- The original result shows that a change of data induces an isomorphism of HF groups. Therefore the *isomorphism class of* groups is well defined.
- It is a result of Juhász and Thurston that the homology groups are well-defined and not just their isomorphism classes.

The homologies HF^+ , HF^- , HF^∞ and \widehat{HF} are independent of the choices made and are invariants of (Y, \mathfrak{s}) . Moreover, if Y is a rational homology sphere, then $HF^\infty(Y, \mathfrak{s}) = \mathbb{Z}_2[U, U^{-1}]$.

- The original result shows that a change of data induces an isomorphism of HF groups. Therefore the *isomorphism class of* groups is well defined.
- It is a result of Juhász and Thurston that the homology groups are well-defined and not just their isomorphism classes.
- There is a subtle difference between having an isomorphism class of a group or a group.

A Heegaard diagram for L(p, q) is as on the picture.

The complex for L(3, 1) has three generators and no differentials. Each generator corresponds to another spin-c structure. We get that $CF^{-}(L(3, 1), \mathfrak{s}) \cong \mathbb{Z}_{2}[U]$ for each \mathfrak{s} . The same statement hold for every lens space.

A (B) < (B) < (B) < (B) </p>

Definition

A rational homology three–sphere is called an *L–space* if for every spin-c structure \mathfrak{s} we have $\widehat{HF}(Y,\mathfrak{s}) = \mathbb{Z}_2$ and $HF^-(Y,\mathfrak{s}) = \mathbb{Z}_2[U]$ (these two are equivalent to each other and also equivalent to saying that $HF^+ = \mathbb{Z}_2[U, U^{-1}]/Z_2[U]$).

Definition

A rational homology three–sphere is called an *L–space* if for every spin-c structure \mathfrak{s} we have $\widehat{HF}(Y,\mathfrak{s}) = \mathbb{Z}_2$ and $HF^-(Y,\mathfrak{s}) = \mathbb{Z}_2[U]$ (these two are equivalent to each other and also equivalent to saying that $HF^+ = \mathbb{Z}_2[U, U^{-1}]/Z_2[U]$).

Problem

Suppose (Y_1, \mathfrak{s}_1) and (Y_2, \mathfrak{s}_2) are two three–manifolds. Prove the following Künneth formula for CF^- and CF^{∞} :

$$CF^{-}(Y_1 \# Y_2, \mathfrak{s}_1 \# \mathfrak{s}_2) \cong CF^{-}(Y_1, \mathfrak{s}_1) \otimes CF^{-}(Y_2, \mathfrak{s}_2).$$

Maciej Borodzik (Institute of Mathematics, PoHeegaard Floer homologies and rational cusp Warsaw, February 2016 13 / 45

Suppose Y has $b_1(Y) > 0$. Let $Z \subset Y$ be a closed oriented surface in Y. If $HF^+(Y, \mathfrak{s}) \neq 0$, then $|\langle c_1(\mathfrak{s}), Z \rangle| \leq 2g(Z) - 2$.

Suppose Y has $b_1(Y) > 0$. Let $Z \subset Y$ be a closed oriented surface in Y. If $HF^+(Y, \mathfrak{s}) \neq 0$, then $|\langle c_1(\mathfrak{s}), Z \rangle| \leq 2g(Z) - 2$.

This is the one of the two main technical tools in dealing with Heegaard Floer theory. This is also one of the sources of its power.

Surgery exact sequence

Theorem

Suppose Y is a homology three–sphere and $K \subset Y$ is a knot. Then there exists an exact sequence

$$\ldots \rightarrow HF^+(Y) \rightarrow HF^+(Y_0) \rightarrow HF^+(Y_1) \rightarrow HF^+(Y) \rightarrow \ldots,$$

where Y_1 is the +1 surgery and Y_0 is the 0-surgery.

Idea of proof.

Construct a suitable triple Heegaard diagram and define various maps by counting holomorphic triangles.

- Reprove the Kronheimer–Mrowka result on the unknotting number of torus knots.

The inequality for *d*-invariants is strong enough to:

- Reprove the Donaldson's diagonalization theorem.
- Reprove the Kronheimer–Mrowka result on the unknotting number of torus knots.
- many other things.

A glimpse into the future

Corollary

If (Y, \mathfrak{s}) bounds a rational homology ball W (that is $H_k(W; \mathbb{Q}) = 0$ for $k \ge 1$) and the spin-c structure \mathfrak{s} extends over W, then $d(Y, \mathfrak{s}) = 0$.

A glimpse into the future

Corollary

If (Y, \mathfrak{s}) bounds a rational homology ball W (that is $H_k(W; \mathbb{Q}) = 0$ for $k \ge 1$) and the spin-c structure \mathfrak{s} extends over W, then $d(Y, \mathfrak{s}) = 0$.

Remark

Being a rational homology ball is the same as being a \mathbb{Q} -acyclic surface. In particular, a complement of a rational cuspidal curve C in $\mathbb{C}P^2$ is a rational homology ball.

A glimpse into the future

Corollary

If (Y, \mathfrak{s}) bounds a rational homology ball W (that is $H_k(W; \mathbb{Q}) = 0$ for $k \ge 1$) and the spin-c structure \mathfrak{s} extends over W, then $d(Y, \mathfrak{s}) = 0$.

Remark

Being a rational homology ball is the same as being a \mathbb{Q} -acyclic surface. In particular, a complement of a rational cuspidal curve C in $\mathbb{C}P^2$ is a rational homology ball.

Question

How to calculate d-invariants?

A *doubly pointed* Heegaard diagram is $(\Sigma, \alpha, \beta, z, w)$ with z, w disjoint from α and β .

A *doubly pointed* Heegaard diagram is $(\Sigma, \alpha, \beta, z, w)$ with z, w disjoint from α and β . Connect z and w by an arc in both handlebodies. We get a knot in $K \subset Y$. We say that the diagram represents the knot.

Problem

Show that for any null-homologous knot K in Y there exists a doubly pointed Heegaard diagram representing that knot.

A *doubly pointed* Heegaard diagram is $(\Sigma, \alpha, \beta, z, w)$ with z, w disjoint from α and β . Connect z and w by an arc in both handlebodies. We get a knot in $K \subset Y$. We say that the diagram represents the knot.

Problem

Show that for any null-homologous knot K in Y there exists a doubly pointed Heegaard diagram representing that knot.

We think of a knot as a of a doubly pointed Heegaard diagram.

The second point w diagram induces a (relative) filtration on CF^- .

イロト イポト イヨト イヨト

The second point *w* diagram induces a (relative) filtration on CF^- . Write $A(x) - A(y) = n_w(\phi) - n_z(\phi)$.

The second point *w* diagram induces a (relative) filtration on CF^- . Write $A(x) - A(y) = n_w(\phi) - n_z(\phi)$.

Lemma

We have
$$\sum_{x \in \mathbb{T}_{\alpha} \cap \mathbb{T}_{\beta}} (-1)^{M(x)} q^{A(x)} = \Delta(q).$$

There are several ways to define homologies.

• Take generators for \widehat{CF} and count only disks that do not intersect z and w. Get \widehat{HFK} .

4 日本 4 周本 4 日本 4 日本

• Detects the genus. That is, $g(K) = \max\{i: \widehat{HFK}_*(K, i) \neq 0\}$.

イロト 不得 トイヨト イヨト

- Detects the genus. That is, $g(K) = \max\{i : \widehat{HFK}_*(K, i) \neq 0\}$.
- In particular, it detects the unknot. The proof is much easier than for Khovanov.

- Detects the genus. That is, $g(K) = \max\{i : \widehat{HFK}_*(K, i) \neq 0\}$.
- In particular, it detects the unknot. The proof is much easier than for Khovanov.
- Detects fibredness, a knot *K* is fibred if and only if $\widehat{HFK}_*(K,g) = \mathbb{Z}$.

- Detects the genus. That is, $g(K) = \max\{i : \widehat{HFK}_*(K, i) \neq 0\}$.
- In particular, it detects the unknot. The proof is much easier than for Khovanov.
- Detects fibredness, a knot *K* is fibred if and only if $\widehat{HFK}_*(K,g) = \mathbb{Z}$.
- The *τ*-invariant, *τ*(*K*) = − max{*s*: ∃*x* ∈ *HFK*[−]_{*}(*K*, *s*): *U^jx* ≠ 0} is a concordance invariant, equal to 2*g*(*K*) for all positive knots, detecting the unknotting number of positive knots.

Let $K \subset S^3$ be a knot. Take ball B^4 and glue to it a two-handle along K with framing q. We obtain a 4-manifold N with boundary $S_q^3(K)$. The core of the handle and a Seifert surface for K form a closed surface F that generates $H_2(N; \mathbb{Z})$.

Let $K \subset S^3$ be a knot. Take ball B^4 and glue to it a two-handle along K with framing q. We obtain a 4-manifold N with boundary $S_q^3(K)$. The core of the handle and a Seifert surface for K form a closed surface F that generates $H_2(N; \mathbb{Z})$.

Theorem

For every $m \in [-q/2, q/2) \cap \mathbb{Z}$ there exists a unique spin-c structure \mathfrak{s}_m on Y that extends to a spin-c structure \mathfrak{t}_m on N characterized by the property that $\langle c_1(\mathfrak{t}_m), F \rangle + 2m = q$

Let $K \subset S^3$ be a knot. Take ball B^4 and glue to it a two-handle along K with framing q. We obtain a 4-manifold N with boundary $S_q^3(K)$. The core of the handle and a Seifert surface for K form a closed surface F that generates $H_2(N; \mathbb{Z})$.

Theorem

For every $m \in [-q/2, q/2) \cap \mathbb{Z}$ there exists a unique spin-c structure \mathfrak{s}_m on Y that extends to a spin-c structure \mathfrak{t}_m on N characterized by the property that $\langle c_1(\mathfrak{t}_m), F \rangle + 2m = q$

The bottom line: think of spin-c structures as of integers in some interval!

A CFK^∞ allows us to calculate the Heegaard Floer homologies of surgeries on knots.

イロト イポト イヨト イヨト

A CFK^{∞} allows us to calculate the Heegaard Floer homologies of surgeries on knots. The formula is in general very complex and involves a mapping cone on many copies of subcomplexes $CFK^{\infty}(i > 0)$.

Surgeries

A CFK^{∞} allows us to calculate the Heegaard Floer homologies of surgeries on knots. The formula is in general very complex and involves a mapping cone on many copies of subcomplexes $CFK^{\infty}(i > 0)$. If the surgery coefficient is large, by some clever application of the adjunction inequality we can show that the formula greatly simplifies.

Theorem

Suppose $K \subset S^3$ and q > 2g(K). Let $Y = S_q^3(K)$. Then $CF^-(Y, \mathfrak{s}_m) \cong CFK^{\infty}(K) (i < 0, j < m)$ and $CF^+(Y, \mathfrak{s}_m) \cong CFK^{\infty}/(i < 0, j < m)$.

Theorem

Suppose $K \subset S^3$ and q > 2g(K). Let $Y = S^3_q(K)$. Then $CF^-(Y, \mathfrak{s}_m) \cong CFK^{\infty}(K) (i < 0, j < m)$ and $CF^+(Y, \mathfrak{s}_m) \cong CFK^{\infty}/(i < 0, j < m)$.

Definition

A knot is called an *L*-space knot if there exists a positive surgery on *K* which is an L-space.

Definition

A knot is called an *L*-space knot if there exists a positive surgery on *K* which is an L-space.

Theorem (Hedden 2006)

Algebraic knots are L-space knots.

Definition

A knot is called an *L*-space knot if there exists a positive surgery on *K* which is an L-space.

Theorem (Hedden 2006)

Algebraic knots are L-space knots.

Theorem (Krcatovich 2013)

An L-space knot is prime, in particular a connected sum of two algebraic knots is not an L-space knot.

Definition

A knot is called an *L*-space knot if there exists a positive surgery on *K* which is an L-space.

Theorem (Hedden 2006)

Algebraic knots are L-space knots.

Theorem (Krcatovich 2013)

An L-space knot is prime, in particular a connected sum of two algebraic knots is not an L-space knot.

L–space knots have the CFK^{∞} determined from the Alexander polynomial.

$$\Delta_{4,7} = t^{18} - t^{17} + t^{14} - t^{13} + t^{11} - t^9 + t^7 - t^5 + t^4 - t + 1.$$

2

$$\Delta_{4,7} = t^{18} - t^{17} + t^{14} - t^{13} + t^{11} - t^9 + t^7 - t^5 + t^4 - t + 1.$$

2

$$\Delta_{4,7} = t^{18} - t^{17} + t^{14} - t^{13} + t^{11} - t^9 + t^7 - t^5 + t^4 - t + 1.$$

CFK^{∞} for -T(3,4)

- The situation is completely different than for positive T(3,4).
- A generator of homology of the complex is a sum of filtered elements.

CFK^{∞} for -T(3,4)

- The situation is completely different than for positive T(3,4).
- A generator of homology of the complex is a sum of filtered elements.
- It is not a filtered element, that is an element at bifiltration element (x, y) that is non-zero in the quotient by

 $\vec{CFK}^{\infty}(i \le x-1, j \le y) + CFK^{\infty}(i \le x, j \le y-1).$

Problem

Show that for a singularity $x^p - y^q = 0$ with p, q coprime, the semigroup is generated by p and q.

Problem

Show that for a singularity $x^p - y^q = 0$ with p, q coprime, the semigroup is generated by p and q.

Problem

Show that for a singularity $x^p - y^q = 0$ with p, q coprime, the semigroup is generated by p and q.

Problem

Show that for a singularity $x^p - y^q = 0$ with p, q coprime, the semigroup is generated by p and q.

- If p = 4, q = 7, the semigroup is $S_{4,7} := (0, 4, 7, 8, 11, 12, 14, 15, 16, 18, 19, 20, 21, ...).$
- The gap sequence is $G_{4,7} = \{1, 2, 3, 5, 6, 9, 10, 13, 17\}.$

Problem

Show that for a singularity $x^p - y^q = 0$ with p, q coprime, the semigroup is generated by p and q.

- If p = 4, q = 7, the semigroup is $S_{4,7} := (0, 4, 7, 8, 11, 12, 14, 15, 16, 18, 19, 20, 21, ...).$
- The gap sequence is $G_{4,7} = \{1, 2, 3, 5, 6, 9, 10, 13, 17\}.$
- We have #G_{4,7} = μ/2 and max{x ∈ G_{4,7}} = 17 = μ − 1. this is a special property of semigroups of singular points!

Problem

Show that for a singularity $x^p - y^q = 0$ with p, q coprime, the semigroup is generated by p and q.

- If p = 4, q = 7, the semigroup is $S_{4,7} := (0, 4, 7, 8, 11, 12, 14, 15, 16, 18, 19, 20, 21, ...).$
- The gap sequence is $G_{4,7} = \{1, 2, 3, 5, 6, 9, 10, 13, 17\}.$
- We have $\#G_{4,7} = \mu/2$ and max $\{x \in G_{4,7}\} = 17 = \mu 1$.

Problem

Show that for a singularity $x^p - y^q = 0$ with p, q coprime, the semigroup is generated by p and q.

- If p = 4, q = 7, the semigroup is $S_{4,7} := (0, 4, 7, 8, 11, 12, 14, 15, 16, 18, 19, 20, 21, ...).$
- The gap sequence is $G_{4,7} = \{1, 2, 3, 5, 6, 9, 10, 13, 17\}.$
- We have $\#G_{4,7} = \mu/2$ and max $\{x \in G_{4,7}\} = 17 = \mu 1$.

For a semigroup *S* with a gap sequence *G* we define

イロト イポト イヨト イヨト

Definition

The gap function is defined as

$$I(m) := \#\{x \in \mathbb{Z}, x \ge m, x \notin S\}.$$

We have

$$I_{4,7}(5) = \#\{5,6,9,10,13,17\} = 6.$$

Always $I(0) = \mu/2$, I(x) = 0 for $x \ge \mu$ and $I(-n) = n + \mu/2$ for n > 0.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

Definition

The gap function is defined as

$$I(m):=\#\{x\in\mathbb{Z},\ x\geq m,\ x\not\in S\}.$$

We have

$$\mathit{I}_{4,7}(5) = \#\{5,6,9,10,13,17\} = 6.$$

Always $I(0) = \mu/2$, I(x) = 0 for $x \ge \mu$ and $I(-n) = n + \mu/2$ for n > 0.

Theorem

For an algebraic knot J(m) = -2I(m+g), where $g = \mu/2$ is the genus.

Gap function for connected sums

A connected sum of algebraic knots is not an L–space knot. But some part of the theory survives.

Gap function for connected sums

A connected sum of algebraic knots is not an L–space knot. But some part of the theory survives.

Definition

For two functions $I_1, I_2 : \mathbb{Z} \to \mathbb{Z}$ bounded from below define their *infimal* convolution by $I_1 \diamond I_2(k) = \min_{n \in \mathbb{Z}} I_1(n) + I_2(k - n)$.

A connected sum of algebraic knots is not an L–space knot. But some part of the theory survives.

Definition

For two functions $I_1, I_2 : \mathbb{Z} \to \mathbb{Z}$ bounded from below define their *infimal* convolution by $I_1 \diamond I_2(k) = \min_{n \in \mathbb{Z}} I_1(n) + I_2(k - n)$.

Theorem

Let $K = K_1 \# \dots \# K_n$ be a connected sum of algebraic knots. Gap functions are I_1, \dots, I_n . Set $I = I_1 \diamond \dots \diamond I_n$. Then J(m) = -2I(m+g), where J is the minimal grading ...

Proposition

Let K be a connected sum of algebraic knots. Then

$$d(S_q^3(K),\mathfrak{s}_m)=\frac{(q-2m)^2-q}{4q}-2l(m+g).$$

Maciej Borodzik (Institute of Mathematics, PoHeegaard Floer homologies and rational cusp Warsaw, February 2016 38 / 45

Proposition

Let K be a connected sum of algebraic knots. Then

$$d(S_q^3(K),\mathfrak{s}_m)=rac{(q-2m)^2-q}{4q}+J(m).$$

Maciej Borodzik (Institute of Mathematics, PoHeegaard Floer homologies and rational cusp Warsaw, February 2016 38 / 45

Joint project with Hom and Schinzel. Use Involutive Floer homology for finer obstruction.

Definition

For an algebraic knot *K* with a staircase, the *stretch* is the length of the middle step of a staircase. A knot is called *even* or *odd* if the staircase has an even or odd number of steps.

The stretch of the staircase for T(4,5) is 2. This knot is odd.

44 / 45

Theorem (Hom, Schinzel, -)

Let p, q be coprime. Write the continuous fraction expansion $q/p = [a_0; a_1; ...; a_k]$. Then the stretch of T(p, q) is equal to $[\frac{a_k-1}{2}] + 1$.

Theorem (Hom, Schinzel, -)

Let p, q be coprime. Write the continuous fraction expansion $q/p = [a_0; a_1; ...; a_k]$. Then the stretch of T(p, q) is equal to $[\frac{a_k-1}{2}] + 1$.

Theorem (Hom, Schinzel, –)

Let *C* be a rational cuspidal curve with knots K_1, \ldots, K_n . Suppose K_1 is odd. Then the stretch of K_1 is less or equal than $g(K_2) + \ldots + g(K_n)$.

Theorem (Hom, Schinzel, -)

Let p, q be coprime. Write the continuous fraction expansion $q/p = [a_0; a_1; ...; a_k]$. Then the stretch of T(p, q) is equal to $[\frac{a_k-1}{2}] + 1$.

We have only this result for curves of odd degree.

Theorem (Hom, Schinzel, -)

Let *C* be a rational cuspidal curve with knots K_1, \ldots, K_n . Suppose K_1 is odd. Then the stretch of K_1 is less or equal than $g(K_2) + \ldots + g(K_n)$.

Remark

This obstructs some cases with one 'big' singularity and some small.
