

Fast Parallel Algorithms for Graph Matching Problems

Marek Karpinski

Department of Computer Science
University of Bonn

Wojciech Rytter

Department of Computer Science
University of Warsaw and Liverpool University

CONTENTS

- **Preface.** *Why parallel matchings are interesting ?*
- **Chapter 1.** *Introduction*
 - Matchings in graphs; terminology, examples.
 - The model of parallel computations: *PRAM*.
 - The complexity classes *NC* and *RNC*.
- **Chapter 2.** *Combinatorial tools*
 - Augmenting paths.
 - Deficiencies and witness sets.
 - Bipartite graphs and their witness sets.
 - Tutte's theorem and witness sets in general graphs.
 - Odd-set covers.
 - Good-edges lemma.
- **Chapter 3.** *Three sequential algorithms*
 - Hopcroft Karp algorithm.
 - Edmonds algorithm and blossoms.
 - The structural algorithm (no blossoms).
- **Chapter 4.** *Probabilistic tools*
 - Terminology and some simple estimations.
 - Isolating lemma.
 - Large redundancy lemma.
 - Estimating probability of nonzero sums.
 - Removing large proportion of elements.
 - A probabilistic tool for construction of deterministic algorithms.
- **Chapter 5.** *Algebraic tools*
 - Determinants versus permanents
 - Testing if polynomial is identically zero.
 - Partial randomized interpolation.
 - Sparse polynomials.
 - Randomized computation of the smallest degree.
 - NC*-computations of the rank of the matrix *NC*-computation of determinants
- **Chapter 6.** *Maximum cardinality matchings*
 - Constructing black-box polynomials
 - Applying the partial interpolation.
 - From Monte Carlo to Las Vegas.

Graphs with small number of perfect matchings.
Applying the Smallest-Degree algorithm.

- **Chapter 7.** *Inclusion maximal matchings*
An NC-algorithm
A simple RNC-algorithm
- **Chapter 8.** *Maximal independent sets*
An NC-algorithm.
A simple randomized algorithm
Maximal independent sets in hypergraphs.
 k -dependent sets.
- **Chapter 9.** *Four easy subclasses of graphs*
Trees.
Dense graphs
Regular bipartite graphs. Claw-free graphs and pseudo matchings.
- **Chapter 10.** *Convex bipartite graphs*
The greedy sequential algorithm.
Left-justification of set families.
The algorithm for general case.
- **Chapter 11.** *f -Matchings.*
A simple RNC-algorithm.
An NC-algorithm.
- **Chapter 12.** *Parallelization of sequential algorithms*
Parallel version of Hopcroft-Karp algorithm.
Parallel implementation of BFS and Disjoint_Paths
NC-approximation of maximum matchings.
Bipartite expanders.
Applying planar separator theorem.
Parallel version of Edmonds algorithm.
- **Chapter 13.** *Pfaffians, counting the number of matchings, and planar graphs*
Pfaffians of Graphs
Skew Symmetric Determinants and Pfaffians
Pfaffians and Counting the Number of Perfect Matchings
Bibliographic Notes
- **Chapter 14.** *Basic applications of matchings to other problems*
Subtree isomorphism.
Maximum flows and disjoint paths

Parallel *Depth First Search*.

- **Chapter 15.** *More applications*

Unary Chinese postman problem.

Two-processors scheduling.

Even cycle covers and shortest *superstrings*.

$\frac{3}{2}$ -approximation of Euclidean TSP.

Approximating the minimum bandwidth.

3-Hypertrees and approximating Steiner trees.

- **Bibliography.**
