---

Recall that a Del Pezzo surface  $S$  with  $r = \rho(S) - 1$  is obtained by blowing up  $r$  points on  $\mathbb{P}^2$ . We will assume that  $r \geq 3$ . We proved that in this case the cone  $\mathcal{C}(S_r)$  is generated by classes of  $(-1)$  curves. We will identify spaces  $N_1(S_r) = N^1(S_r)$  and call it  $N(S_r)$ . We use the lattice  $\text{Pic } S_r \subset N(S_r)$ , by  $l_0$  we denote the classes of a (general) line on  $\mathbb{P}^2$  (pulled back to  $S_r$ ) and by  $l_1, \dots, l_r$  the classes of exceptional curves. The present series of problems is inspired by Manin's book *Cubic forms* Chapter IV

1. Consider a linear subspace  $\Lambda_r \subset N(S_r)$  orthogonal to the anticanonical class  $-K_{S_r}$ .
  - (a) Prove that  $l_0 - l_1 - l_2 - l_3$  and  $l_1 - l_2, l_1 - l_2, \dots, l_1 - l_r$  make a basis of  $\Lambda_r$ . Prove that each of these vectors have intersection  $(-2)$ .
  - (b) By  $Q_r$  denote the lattice in  $\Lambda_r$  generated by the classes enumerated above and by  $Q_r^\vee$  we denote the dual lattice  $Q_r^\vee = \{w \in \Lambda_r : (w, v) \in \mathbb{Z} \ \forall v \in Q_r\}$ . Prove that  $Q_r^\vee/Q_r \simeq \mathbb{Z}_{9-r}$ .
2. Elements of  $v \in Q_r$  such that  $(v, v) = -2$  will be called roots; their set is denoted by  $R_r$ .
  - (a) Let  $v = al_0 + \sum_1^r b_i l_i$  be a root, prove that  $3a = \sum_1^r b_i$  and  $a^2 - \sum_1^r b_i^2 = -2$
  - (b) Prove that, up to permutation of positive  $i$ 's and changing signs of  $a$  and  $b_i$ 's there are only the following solutions of the above equations:
    - i.  $l_i - l_j, i \neq j, i, j > 0$
    - ii.  $l_0 - l_1 - l_2 - l_3$
    - iii.  $2l_0 - l_1 - l_2 - l_3 - l_4 - l_5 - l_6$ , if  $r \geq 6$
    - iv.  $3l_0 - 2l_1 - l_2 - l_3 - l_4 - l_5 - l_6 - l_7 - l_8$ , if  $r = 8$
  - (c) Using the above presentation of roots find its number; these should be as follows for the respective  $r$ 's:

$r$	3	4	5	6	7	8
$ R_r $	8	20	40	72	126	240

3. We will try to recalculate the number of roots using polytopes  $\Gamma(S_r)$  introduced in the previous set of problems. Let us recall that we have calculated face polynomials for polytopes  $\Gamma(S_r)$ :

$$\begin{aligned}
 P_3 &= 1 + 6x + 9x^2 + 2x^3 + 3x^3y \\
 P_4 &= 1 + 10x + 30x^2 + 30x^3 + 5x^4 + 5x^4y \\
 P_5 &= 1 + 16x + 80x^2 + 160x^3 + 120x^4 + 16x^5 + 10x^5y \\
 P_6 &= 1 + 27x + 216x^2 + 720x^3 + 1080x^4 + 648x^5 + 72x^6 + 27x^6y \\
 P_7 &= 1 + 56x + 756x^2 + 4032x^3 + 10080x^4 + 12096x^5 + 6048x^6 + \\
 &\quad + 756x^7 + 126x^7y
 \end{aligned}$$

- (a) Prove that every root  $v$  can be presented as a difference of two non-meeting  $(-1)$  curves on  $S_r$ , say  $v = \gamma_1 - \gamma_2$ , where each  $\gamma_i$  is a class of a  $(-1)$  curve, a vertex in the polytope  $\Gamma(S_r)$ . Prove that there is an edge of  $\Gamma(S_r)$  containing  $\gamma_1$  and  $\gamma_2$ , we denote it  $\langle \gamma_1, \gamma_2 \rangle < \Gamma$
- (b) Prove that the above presentation is non-unique, that is for  $r \leq 6$  if  $\gamma_1 - \gamma_2 = \gamma_3 - \gamma_4$ , for  $(\gamma_1, \gamma_2) \neq (\gamma_3, \gamma_4)$ , then  $\langle \gamma_1, \gamma_2 \rangle$  and  $\langle \gamma_3, \gamma_4 \rangle$  are edges in in a cross polytope, a facet of  $\Gamma(S_r)$  dual to type 1 vertex of  $\Delta(S_r)$ . Conclude that the number of presentations of a root in  $R_r$  as edges of  $\Gamma(S_r)$  is equal to the number of vertices of type 1 in  $\Delta(S_{r-2})$  plus 1.
- (c) Find a similar condition for  $r = 7, 8$
- (d) Using the above information recalculate the number of roots.
4. For  $r = 3, \dots, 6$  find roots in  $R_r$  consisting of vectors  $\alpha_1, \dots, \alpha_r$  such that  $(\alpha_i, \alpha_j) = 1$  if only if the respective  $\bullet$ 's are connected in one of the Dynkin diagrams; otherwise  $(\alpha_i, \alpha_j) = 0$

- (a) for example, for  $r = 3$ , take  $\alpha_1 = l_0 - l_1 - l_2 - l_3$ ,  $\alpha_2 = l_1 - l_2$ ,  $\alpha_3 = l_2 - l_3$

$$A_1 \times A_2 : \quad \begin{array}{ccc} \alpha_1 & \alpha_2 & \alpha_3 \\ \bullet & \bullet & \bullet \\ & \text{---} & \text{---} \end{array}$$

- (b)

$$A_4 : \quad \begin{array}{cccc} \alpha_1 & \alpha_2 & \alpha_3 & \alpha_4 \\ \bullet & \bullet & \bullet & \bullet \\ \text{---} & \text{---} & \text{---} & \text{---} \end{array}$$

- (c)

$$D_5 : \quad \begin{array}{cccc} \alpha_2 & \alpha_1 & \alpha_4 & \alpha_5 \\ \bullet & \bullet & \bullet & \bullet \\ \text{---} & \text{---} & \text{---} & \text{---} \\ & | & & \\ & \bullet & & \\ & \alpha_3 & & \end{array}$$

(d)
