Periodic knots

Definition

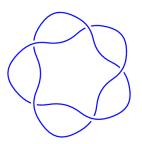

A knot $K \subset S^3$ is *p*-periodic if it admits a rotational symmetry with the symmetry axis disjoint from *K*.

< ロ > < 同 > < 回 > < 回 >

Periodic knots

Definition

A knot $K \subset S^3$ is *p*-periodic if it admits a rotational symmetry with the symmetry axis disjoint from *K*.

Theorem (Murasugi criterion)

Suppose $K \subset S^3$ is a p-periodic knot with p a prime. Let Δ be the Alexander polynomial of K and Δ' be the Alexander polynomial of the quotient knot K/\mathbb{Z}_p . Let I be the absolute value of linking number of K with the symmetry axis. Then $\Delta_0|\Delta$ and up to multiplication by a power of t we have

$$\Delta \equiv \Delta_0^p (1+t+\ldots+t^{l-1})^{p-1} \bmod p. \tag{1}$$

< 6 b

Theorem (Murasugi criterion)

Suppose $K \subset S^3$ is a p-periodic knot with p a prime. Let Δ be the Alexander polynomial of K and Δ' be the Alexander polynomial of the quotient knot K/\mathbb{Z}_p . Let I be the absolute value of linking number of K with the symmetry axis. Then $\Delta_0|\Delta$ and up to multiplication by a power of t we have

$$\Delta \equiv \Delta_0^p (1+t+\ldots+t^{l-1})^{p-1} \bmod p.$$
(1)

Often one can find factors of Δ over integers.

• Suppose \mathbb{Z}_p acts on S^3 keeping K;

- Suppose \mathbb{Z}_p acts on S^3 keeping K;
- Then \mathbb{Z}_p acts on $\Sigma^m(K) k$ -fold branched cover;

ъ

- Suppose \mathbb{Z}_p acts on S^3 keeping K;
- Then \mathbb{Z}_p acts on $\Sigma^m(K) k$ -fold branched cover;
- Then Z_p acts on $H_1(\Sigma^m(K))$.

- Suppose \mathbb{Z}_p acts on S^3 keeping K;
- Then \mathbb{Z}_p acts on $\Sigma^m(K) k$ -fold branched cover;
- Then Z_p acts on $H_1(\Sigma^m(K))$.
- Look at \mathbb{Z}_{q^m} summands of $H_1(\Sigma^m(K))$.

- Suppose \mathbb{Z}_p acts on S^3 keeping K;
- Then \mathbb{Z}_p acts on $\Sigma^m(K) k$ -fold branched cover;
- Then Z_p acts on $H_1(\Sigma^m(K))$.
- Look at \mathbb{Z}_{q^m} summands of $H_1(\Sigma^m(K))$.
- \mathbb{Z}_p can fix it, or permute different such summands.

- Suppose \mathbb{Z}_p acts on S^3 keeping K;
- Then \mathbb{Z}_p acts on $\Sigma^m(K) k$ -fold branched cover;
- Then Z_p acts on $H_1(\Sigma^m(K))$.
- Look at \mathbb{Z}_{q^m} summands of $H_1(\Sigma^m(K))$.
- \mathbb{Z}_p can fix it, or permute different such summands.
- The number of fixed components is controlled by $|\Delta'(-1)|$.

- \mathbb{Z}_p can fix it, or permute different such summands.
- The number of fixed components is controlled by $|\Delta'(-1)|$.
- Restrictions for $H_1(\Sigma^m(K))$ of periodic knots.

• Consider $\Sigma^k(K)$;

э

- Consider $\Sigma^k(K)$;
- \mathbb{Z}_p acts on the spin-c structures.

ъ

- Consider $\Sigma^k(K)$;
- \mathbb{Z}_p acts on the spin-c structures.
- Acts on Ozsváth-Szabó d-invariants.

- Consider $\Sigma^k(K)$;
- \mathbb{Z}_p acts on the spin-c structures.
- Acts on Ozsváth–Szabó *d*–invariants.
- These invariants appear with multiplicities.

- Consider $\Sigma^k(K)$;
- \mathbb{Z}_p acts on the spin-c structures.
- Acts on Ozsváth–Szabó *d*–invariants.
- These invariants appear with multiplicities.
- If K is quasi-alternating, then Σ²(K) is an L–space and d-invariants are computable.

• Hillman, Livingston and Naik generalize the Murasugi's periodicity criterion for twisted Alexander polynomials.

- Hillman, Livingston and Naik generalize the Murasugi's periodicity criterion for twisted Alexander polynomials.
- Computable, if we know a representation.

- Hillman, Livingston and Naik generalize the Murasugi's periodicity criterion for twisted Alexander polynomials.
- Computable, if we know a representation.
- It is known when knot group admits a representation into a dihedral group.

- Hillman, Livingston and Naik generalize the Murasugi's periodicity criterion for twisted Alexander polynomials.
- Computable, if we know a representation.
- It is known when knot group admits a representation into a dihedral group.
- Other representations are sometimes harder to find.

None of the above criteria can be used for $\Delta = 1$ knots. The TAP criterion is possible, but requires finding non-trivial representations.

4 6 1 1 4

Theorem

If K is p-periodic, then $J_K(q) - J_K(q)^{-1} \equiv 0 \mod (q^p - q^{-p}, p)$.

Theorem

If K is p-periodic, then $J_K(q) - J_K(q)^{-1} \equiv 0 \mod (q^p - q^{-p}, p)$.

Effective for p > 3.

3

BA 4 BA

Theorem

If K is p-periodic, then $J_K(q) - J_K(q)^{-1} \equiv 0 \mod (q^p - q^{-p}, p)$.

Effective for p > 3.

Theorem (HOMFLYPT criterion)

Let \mathcal{R} be a unital subring in $\mathbb{Z}[a^{\pm 1}, z^{\pm 1}]$ generated by $a, a^{-1}, \frac{a+a^{-1}}{z}$ and z. For a prime number p let \mathcal{I}_p be the ideal in \mathcal{R} generated by p and z^p . If a knot K is p-periodic and P(a, z) is its HOMFLYPT polynomial, then

$$P(a,z) \equiv P(a^{-1},z) \mod \mathcal{I}_{p}.$$

Theorem

If K is p-periodic, then $J_K(q) - J_K(q)^{-1} \equiv 0 \mod (q^p - q^{-p}, p)$.

Effective for p > 3.

Theorem (HOMFLYPT criterion)

Let \mathcal{R} be a unital subring in $\mathbb{Z}[a^{\pm 1}, z^{\pm 1}]$ generated by $a, a^{-1}, \frac{a+a^{-1}}{z}$ and z. For a prime number p let \mathcal{I}_p be the ideal in \mathcal{R} generated by p and z^p . If a knot K is p-periodic and P(a, z) is its HOMFLYPT polynomial, then

$$P(a,z) \equiv P(a^{-1},z) \mod \mathcal{I}_{p}.$$

Przytycki shows an effective way of applying Theorem 4.

BA 4 BA

For a periodic diagram *D*, the group Z_p permutes the cube of resolution.

< 6 b

- For a periodic diagram *D*, the group Z_p permutes the cube of resolution.
- Take a ring *R*. Then CKh(*D*; *R*) has a structure of Λ = *R*[ℤ_ρ]−module.

E N 4 E N

- For a periodic diagram *D*, the group Z_p permutes the cube of resolution.
- Take a ring *R*. Then CKh(*D*; *R*) has a structure of Λ = *R*[ℤ_p]–module.

Definition (Politarczyk)

For any Λ -module *M* define the equivariant Khovanov homology as

$$\mathsf{EKh}(L; M) = \mathsf{Ext}_{\Lambda}(M, \mathsf{CKh}(D; R)).$$

- For a periodic diagram *D*, the group Z_p permutes the cube of resolution.
- Take a ring *R*. Then CKh(*D*; *R*) has a structure of Λ = *R*[ℤ_ρ]−module.

Definition (Politarczyk)

For any Λ -module *M* define the equivariant Khovanov homology as

$$\mathsf{EKh}(L; M) = \mathsf{Ext}_{\Lambda}(M, \mathsf{CKh}(D; R)).$$

• Does not depend on the choice of the diagram.

- For a periodic diagram *D*, the group Z_p permutes the cube of resolution.
- Take a ring *R*. Then CKh(D; R) has a structure of $\Lambda = R[\mathbb{Z}_p]$ -module.

Definition (Politarczyk)

For any Λ -module *M* define the equivariant Khovanov homology as

$$\mathsf{EKh}(L; M) = \mathsf{Ext}_{\Lambda}(M, \mathsf{CKh}(D; R)).$$

- Does not depend on the choice of the diagram.
- In a similar way one can show the existence of equivariant Lee theory.

Equivariant Lee spectral sequence

- There exists an equivariant Lee spectral sequence (if *R* = Z_q, *q* > 2, or *R* = Z or *R* = Q).
- Equivariant Lee homology for knots is easy.
- The equivariant Khovanov polynomial and the equivariant Lee polynomial differ by a specific polynomial.

Equivariant Lee spectral sequence

- There exists an equivariant Lee spectral sequence (if R = Zq, q > 2, or R = Z or R = Q).
- Equivariant Lee homology for knots is easy.
- The equivariant Khovanov polynomial and the equivariant Lee polynomial differ by a specific polynomial.
- And $EKh(L; \Lambda)$ splits as a sum over different representations of Λ .

Theorem (—, Politarczyk, 2017)

Let *K* be a p^n -periodic, where *p* is an odd prime. Suppose that $\mathbb{F} = \mathbb{Q}$ or \mathbb{F}_r , for a prime *r* such that $r \neq p$, and *r* has maximal order in the multiplicative group mod p^n . Set c = 1 if $\mathbb{F} = \mathbb{F}_2$ and c = 2 otherwise. Then the Khovanov polynomial KhP(*K*; \mathbb{F}) decomposes as

$$\mathsf{KhP}(K;\mathbb{F}) = \mathcal{P}_0 + \sum_{j=1}^n (p^j - p^{j-1})\mathcal{P}_j, \tag{2}$$

where

$$\mathcal{P}_0, \mathcal{P}_1, \ldots, \mathcal{P}_n \in \mathbb{Z}[q^{\pm 1}, t^{\pm 1}],$$

are Laurent polynomials such that
